Формулируются некоторые гипотезы концепции естественного происхождения первого разумного существа и искусственного происхождения нашей структурированной вселенной. Высказывается гипотеза о сущности телепортации.

E.Ya.Smirnov. Certain hypotheses are formulated with regard to the concept of natural origin of the first sensible creature and artificial origin of our structured universe. A hypothesis of the essence of teleportation is suggested.

The main theses are as follows. Atoms (indivisible) are tachions, i.e. particles with their mass being many times less than that of an electron and their inertial motion velocity being many times higher than the velocity of light. The diverse forms of matter are different associations of atoms which occurred under the influence of gravitational and inertial forces. The movement of matter takes place in three-dimensional Euclidean space not liable to the “bending” and “swinging” effects. Time is one of the characteristics of matter. The germ of the Sense originated in the medium of tachions as a thinking association of atoms. Our structured universe is “hand-made”.

In 1989 I for the first time witnessed and took part in a strong poltergeist which expressed in various teleportations, occurrence of various records on tape reels, etc. From those records it followed that the poltergeist was organized by some creatures which had come from the world of tachions and called themselves “efimisms”. Like people, they are “complex systems with artificial intellect, created by the cosmic Supreme” (in 1998 this information together with corresponding tape records were given to the Organizational Committee of the previous congress for fundamental problems of science).

After I came upon the “efimisms”, despite my being a staunch atheist I had to revise my views. Now I am still a materialist, but I think that God exists and evidently is the only sensible creature of natural origin. It seems that the “germ of the God” originated accidentally in a form of thinking, though on a rather primitive level, association of tachions and then, by long titanic efforts, created powerful intellect in itself, transforming the surrounding chaos into our structured universe controlled by the mighty Supreme also created by God. In particular, the Supreme ensures the possibility of contacts between any sensible creatures and their limited access to cosmic information data bases (information fields). I think that the self-perfection of God and the Universe is still in progress.

Here are some details:

- my idea of matter and evolution of the Supreme generally agree with that of ancient Greek philosophers, but of course with consideration for the modern level of knowledge
- matter consists of atoms (indivisible) and is located in three-dimensional Euclidean space. Time is one of the characteristics of matter, it allows to fix the dynamics (evolution) of the latter. Therefore the link “space, matter – time” seems to be more correct than the commonly used link “space-time, matter” which occurred after Lorentz’s transformation determining the invariance of velocity of light obtained on imperfect measuring machines, which was erroneous but fruitful on a certain stage. The ideas of “bending” and “swinging” of space also seem to be erroneous consequences of a non-existing invariance of the velocity of light.
- It is possible that there exist several varieties of atoms, but in any case mass of an atom is many times less than that of an electron, and its inertial motion velocity is many times more than the velocity of light.
- Atoms are influenced by gravitational and inertial forces. Under their influence associations of atoms are formed (and broken up). Within an association atoms perform complex curvilinear (like orbital) movements. Velocity of inertial motion of an association of atoms is less than that of both separate atoms forming the association, and their sub-associations.
- Matter of our “hand-made” universe apparently has modular hierarchic structure and may be in one of the four aggregate states: solid, liquid, gaseous, and plasma (the corresponding elements are earth, water, air and fire). I think that there exists a mechanism of transfer of matter from any aggregate state to plasma, which is rather simple from the cosmic technologies point of view. Apparently it is that mechanism that is used in teleportation the essence of which seems to be the transfer of an object to plasma, its movement in space and then returning of the object to the initial state. It seems to me that extraterrestrials, including UFO, move in this way.
- Since matter seems to have hierarchic structure, mathematical models describing its behavior should also have hierarchic structure. As under certain conditions (for certain levels of velocities of movement) mechanical models by Newton and quantum mechanics proved to be sufficiently adequate, then they evidently can be considered as certain simplifications of the general models mentioned above. It may well be that this circumstance will give a key to search of those more general adequate models.
